TC Energy's GTN Xpress Would Pump More Methane Gas Through an Aging System at a Time When Demand in the Region is Declining

Summary:

- In order to approve GTN Xpress, the Federal Energy Regulatory Commission must determine that the project is “necessary,” to avoid saddling ratepayers with extra costs. GTN Xpress is not “necessary” because demand for gas in the region is declining.

- Washington, Oregon, and California’s energy and climate laws require reductions in fracked gas use in the coming years.

- Because demand for gas in the region is declining, GTN Xpress will result in stranded assets, subsidized by ratepayers.

- Without evidence of demand for the gas GTN Xpress would add to the system, it is increasingly likely that utilities contracted for the gas intend to sell the additional gas for profit—a practice that benefits shareholders, while placing all of the risk on ratepayers.
